IBM

Capstone Project - The Battle of
neighbourhoods (Week 1)

**Finding the best areas in Kanpur, India to
open a Shopping Mall**

Introduction

Mall industry has emerged as one of the growing sector in India and also, visiting shopping malls has become a great way to relax and enjoy for the visitors during weekends and holidays. They can do grocery shopping, dine at restaurants, shop at the various fashion outlets, watch movies and perform many more activities. Shopping malls are like a one-stop destination for all types of shoppers. For retailers, the central location and the large crowd at the shopping malls provides a great distribution channel to market their products and services. Property developers are also taking advantage of this trend to build more shopping malls to cater to the demand. Currently there are not many shopping malls in Kanpur but opening shopping malls allows property developers to earn consistent rental income. Of course, as with any business decision, opening a new shopping mall requires serious consideration and is a lot more complicated than it seems. Particularly, the location of the shopping mall is one of the most important decisions that will determine whether the mall will be a success or a failure.

Business Problem

The objective of this capstone project is to analyse and select the best locations in the city of Kanpur, India to open a new shopping mall. Using data science methodology and machine learning techniques like clustering, this project aims to provide solutions to answer the business question: In the city of Kanpur, India, if a property developer is looking to open a new shopping mall, where would you recommend that they open it?

Target Audience of this project

This project is particularly useful to property developers and investors looking to open or invest in new shopping malls in the capital city of India i.e. Kanpur. It will help the developer to decide which areas which have potential to become a relaxing centre for the people of the city and financially wise decision for the investors.

Data

→ To solve the problem, we will need the following data:

- List of neighbourhoods in Kanpur. This defines the scope of this project which is confined to the city of Kanpur, the eighth-most populous metropolitan area in India
- Latitude and longitude coordinates of those neighbourhoods. This is required in order to plot the map and also to get the venue data.

- Venue data, particularly data related to shopping malls. We will use this data to perform clustering on the neighbourhoods.

→ Sources of data and methods to extract them:

This Wikipedia page (https://en.wikipedia.org/wiki/Category:Neighbourhoods_in_Kanpur) contains a list of neighbourhoods in Kanpur, with a total of 21 neighbourhoods.

- We will use web scraping techniques to extract the data from the Wikipedia page, with the help of Python requests and BeautifulSoup packages.
- Then we will get the geographical coordinates of the neighbourhoods using Python Geocoder package which will give us the latitude and longitude coordinates of the neighbourhoods.
- After that, we will use Foursquare API to get the venue data for those neighbourhoods. Foursquare has one of the largest database of 105+ million places and is used by over 125,000 developers. Foursquare API will provide many categories of the venue data, we are particularly interested in the Shopping Mall category in order to help us to solve the business problem put forward.

This is a project that will make use of many data science skills, from web scraping (Wikipedia), working with API (Foursquare), data cleaning, data wrangling, to machine learning (K-means clustering) and map visualization (Folium).
